

MRSA stop
Sterile surface in 180 minutes*

More safety for your residents: Sterile surface in 180 minutes!*

The wibo formula

The antimicrobial coating is not only effective against bacteria but also against viruses (e.g. HIV, influenza etc.), fungi (e.g. black mold) and algae. It is therefore more efficient than regular wipe disinfections and retains its full effectiveness beyond the product life cycle.

Increased danger resulting from MRSA infections

Ever since the introduction of per-case payments in the German healthcare sector, elderly patients are often sent back to the nursing home directly after being treated in the hospital. It is no wonder then that nursing institutions increasingly have problems with MRSA and other germs since they usually do not have adequate hygienic conditions to prevent the transmission of germs to other nursing home residents.

Now, wissner-bosserhoff offers a sophisticated hygienic solution for this problem for the first time. The bed and bedside cabinet areas most commonly touched by residents and nursing staff in everyday care receive an antimicrobial coating. First tests and the implementation at satisfied customers have shown: The antimicrobial effect is not impaired by the use of commercially available disinfectants.

The ionic agent is highly effective against bacteria, viruses, fungi and algae. Ions which are harmless for humans are built constantly and attack the metabolic system of harmful microorganisms.

Your advantages at a glance

- The build-up and transmission of germs is reduced
- The number of infections in nursing homes is reduced
- Antibiotic resistances are reduced
- Reduction of disinfection costs by extending disinfection cycles
- The risk of damage due to cleaning agents is reduced

Permanent germ accumulation and spreading on the most commonly touched nursing home bed and bedside cabinet surfaces are virtually ruled out.

Studies about effectiveness of the antimicrobial additive in nursing home bed and bedside cabinet materials show that an average of 99.9 % of E. coli and micrococcus luteus bacteria as well as 98.4 % of staphylococcus aureus bacteria are eliminated within
